IDENTIFIERS	*Survey of Income and Education

ABSTRACT

This report summarizes data from the 1976 Survey of Income and Education, concerning the labor force participation, work experience, earnings, and unemployment of 32.8 million youth aged 14 to 21. Special attention is paid in the report to the experience of the poor, minorities, and women. Following an initial narrative summary of survey findings in such areas as youth labor force participation, length of commitment to the work force, work experience, mean time worked, earnings, occupations of young workers, length and methods of job search, workers who found no jobs, and public and private employers, conclusions are drawn concerning the special needs of minority populations. The bulk of the report is comprised of 1207 tables presenting various breakdowns of data on the above-mentioned topics according to such factors as sex, age, race, and income level. (Related youth knowledge and development reports are available separately through ERIC--see note.) (MN)

OVERVIEW

The Survey of Income and Education undertaken in 1976 provides an array of detailed information concerning the employment status of youth and related variables. The expanded sample provides reliable information at a level of detail not possible from the Current Population Survey. The key variables in youth labor market patterns are age, race, sex, family income and school status. In contrast to the published CPS data, the cell sizes are adequate to provide data controlled for all these variables. As is frequently the case, this data source has not been fully "mined".

The Labor Market Experience of 14-21-Year-Olds is basically a presentation of this information for use by other analysts. The tables provide detailed data elsewhere not available on the interaction of family income and labor force status, as well as important information concerning the status of Hispanic youth.

This reference volume is one of the products of the "knowledge development" effort implemented under the mandate of the Youth Employment and Demonstration Projects Act of 1977. The knowledge development effort consists of hundreds of separate research, evaluation and demonstration activities which will result in literally thousands of written products. The activities have been structured from the outset so that each is self-standing but also interrelated with a host of other activities. The framework is presented in A Knowledge Development Plan for the Youth Employment and Demonstration Projects Act of 1977, A Knowledge Development Plan for the Youth Initiatives Fiscal 1979 and Completing the Youth Agenda: A Plan for Knowledge Development, Dissemination and Application in Fiscal 1980.

Information is available or will be coming available from the various knowledge development activities to help resolve an almost limitless array of issues, but answers to policy questions will usually require integration and synthesis from a number of separate products, which, in turn, will depend on knowledge and availability of these products. A major shortcoming of past research, evaluation and demonstration activity has been the failure to organize and disseminate the products adequately to assure the full exploitation of the findings. The magnitude and structure of the youth knowledge development effort puts a premium on organization and dissemination.

As part of its knowledge development mandate, therefore, the Office of Youth Programs of the Department of Labor will organize, publish and disseminate the written products of all major research, evaluation and demonstration activities supported directly by or mounted in conjunction with the knowledge development effort.

Some of the same products may also be published and disseminated through other channels, but they will be included in the structured series of Youth Knowledge Development Reports in order to facilitate access and integration.

The Youth Knowledge Development Reports, of which this is one, are divided into twelve broad categories:

1. Knowledge Development Framework: The products in this category are concerned with the structure of knowledge development activities, the assessment methodologies which are employed, validation of measurement instruments, the translation of knowledge into policy, and the strategy for disseminating findings.

2. Research on Youth Employment and Employability Development: The products in this category represent analyses of exist- data, presentation of findings from new data sources, special studies of dimensions of youth labor market problems and policy analyses.

3. Program Evaluations: The products in this category include impact, process and benefit-cost evaluations of youth programs including the Summer Youth Employment Program, Job Corps, the Young Adult Conservation Corps, Youth Employment and Training Programs, Youth Community Conservation and Improvement Projects, and the Targeted Jobs Tax Credit.

4. Service and Participant Mix: The evaluations and demonstrations summarized in this category concern the matching of different types of youth with different service combinations. This involves experiments with work vs. work plus remediation vs. straight remediation as treatment options. It also includes attempts to mix disadvantaged and more affluent participants, as well as youth with older workers.

5. Education and Training Approaches: The products in this category present the findings of structured experiments to test the impact and effectiveness of various education and vocational training approaches including specific education methodologies for the disadvantaged, alternative education approaches and advanced career training.

6. Pre-Employment and Transition Services: The products in this category present the findings of structured experiments to test the impact and effectiveness of school-to-work transition activities, vocational exploration, job-search assistance and other efforts to better prepare youth for labor market success.

7. Youth Work Experience: The products in this category address the organization of work activities, their output, productive roles for youth and the impacts of various employment approaches.

8. Implementation Issues: This category includes cross-cutting analyses of the practical lessons concerning "how-to-do-it." Issues such as learning curves, replication processes and programmatic "batting averages" will be addressed under this category, as well as the comparative advantages of alternative delivery agents.

9. Design and Organizational Alternatives: The products in this category represent assessments of demonstrations of alternative program and delivery arrangements such as consolidation, year-round preparation for summer programming, the use of incentives and multi-year tracking of individuals.

10. Special Needs Groups: The products in this category present findings on the special problems of and adaptations needed for significant segments including minorities, young mothers, troubled youth, Indochinese refugees and the handicapped.

11. Innovative Approaches: The products in this category present the findings of those activities designed to explore new approaches. The subjects covered including the Youth Incentive Entitlement Pilot Projects, private sector initiatives, the national youth service experiment, and energy initiatives in weatherization, low-head hydroelectric dam restoration, windpower and the like.

12. Institutional Linkages: The products in this category will include studies of institutional arrangements and linkages as well as assessments of demonstration activities to encourage such linkages with education, volunteer groups, drug abuse agencies and the like.

In each of these knowledge development categories, there will be a range of discrete demonstration, research and evaluation activities, focused on different policy, program and analytical issues. For instance, all experimental demonstration projects have both process and impact evaluations, frequently undertaken by different evaluation agents. Findings will be published as they become available so that there will usually be a series of reports as evidence accumulates. To organize these products, each publication is classified in one of the twelve broad knowledge development categories, described in terms of the more specific issue, activity or cluster of activities to which it is addressed, with an identifier of the product and what it represents relative to other products in the demonstration. Hence, the multiple products under a knowledge development activity are closely interrelated and the activities in each broad cluster have significant interconnections.

This volume is basically a reference source. Other closely related research volumes include: Fact Book on Youth, A Review of Youth Employment Problems, Programs and Policies, Between Two Worlds: Youth Transition from School to Work, The Causes of Youth Unemployment, Findings of the National Longitudinal Survey of Young Americans, and Youth Unemployment: Its Measurement and Meaning.

THE LABOR MARKET FOR 14-21-YEAR-OLDS

This report summarizes the voluminous information in over 300 pages of special tabulations of the 1976 Survey of Income and Education. It describes the labor force participation, work experience, earnings, and unemployment of 32.8 million young persons age 14 to 21. Special attention is paid in the report to the experience of the poor, minorities and women, groups usually disfavored in the work-place.

LABOR FORCE PARTICIPATION

The proportion of young persons in the labor force is higher than is generally realized, and it tends to increase with age. In 1975, 71.4 percent of all young persons age 14-21 spent at least one week either working or looking for work. Among the 16.8 million 14-17, four out of ten worked or looked for work during that year. By age 18-19, the proportion of youngsters with one or more weeks in the labor force doubled. At age 20-21, 85 percent of 7.9 million young persons were in the labor force at least one week. (See Table 1.)

Table 1.--Labor force participation rates in 1975 of young persons 14-21 by age and poverty level
(percent of total)

	All	Poor	100-124 Percent Poverty Income	Others
Total	61.4	49.3	55.7	73.6
14-17	41.8	33.3	40.1	42.1
18-19	80.8	66.5	77.8	83.3
20-21	85.0	68.2	74.0	87.8
Black	51.2	43.7	53.9	55.6
Hispanic	53.0	39.5	50.2	58.6
Male	65.5	53.7	60.0	67.4
Female	57.2	45.9	51.5	59.6

Sour[illegible] Special tabulations of the SIE.

For young workers 14-17, the labor force participation rates depend a great deal upon whether or not they are enrolled in school. Among 16.6 million youngsters 14-17 who were still enrolled in school full-time in the spring of 1976, only one in eight had participated in the world of work in 1975. However, between the ages of 18 and 21, young people had similar participation rates whether they were enrolled in school or not. (See Table 2.)

Table 2.--Labor force participation rates in 1975 by selected characteristics

(percent of total)

	Enrolled Full-Time 1976	Not Enrolled Total	Not Enrolled High School Graduate	Not Enrolled Not High School Graduate
Total	38.4	84.9	87.6	83.3
14-17	11.5	90.1	83.2	89.9
18-19	83.2	80.0	85.0	73.8
20-21	83.3	86.6	89.1	73.3
Poor	26.0	68.9	76.5	63.5

Source: Special tabulations of the SIE.

Males were more likely to participate in the work force than females at all ages. The labor force participation of males, 65.5 percent, was 15 percent higher than that of females. This disparity between males and females held for persons who were poor and for those at 100-124 percent of the poverty level, as well as for others.

Members of minorities were less likely to be found in the labor force than others of the same age. Among Blacks, only 51 percent of all persons 14-21 reported having looked for work or worked in 1975. This is 12 percent below the participation for all persons 14-21. Among Hispanics, this proportion was 53 percent. The lower labor force participation of minorities occurred at both extremes of the income distribution. Both the poor and those living at above 124 percent of the poverty level had significantly lower labor force participation rates.

Labor force participation varied considerably, depending upon the social and economic background of young workers. Persons living in poverty-level families were 20 percent less likely to work than the average. Those in families with incomes at 100 to 124 percent of the poverty level had labor force participation rates roughly 5 percent below those of the total U.S. population. Young workers living in more affluent circumstances had the highest participation rates. These observations hold for all age levels.

The statistics about young workers who live in poverty or near poverty (100-124 percent of the poverty level) must be interpreted with caution. The proportion of persons living either in poverty or near poverty declines as young persons grow older. In this survey, the proportion of persons in poverty or near poverty declines from 18.7 percent of the 14-17-year-old cohort to 15.7 of all persons age 20-21. It is quite likely that persons with poverty or near-poverty backgrounds who integrate themselves successfully into the labor force during these late teens or early twenties earn sufficient amounts to raise their own or their families' incomes to a level above 124 percent of the poverty level. (See Table 3.)

Table 3.--Percent of poverty-level young persons in selected age cohorts, spring 1976

	Below Poverty	100-124 Percent Poverty	Total Below 124 Percent Poverty
Total	12.6	5.1	17.7
14-17	13.1	5.6	18.7
18-19	12.9	4.9	17.8
20-21	11.4	4.3	15.7

Source: Special tabulations of the SIE.

LENGTH OF COMMITMENT TO THE WORK FORCE

Labor force participation figures only tell part of the story of young people's commitment to the labor force. In order to highlight the differences between various age groups, it is useful to distinguish between the length of time spent working and looking for work. Table 4 shows strikingly different patterns according to age. Thus, only 11 percent of persons 14-17 were in the labor force 40 weeks or more, but this proportion increased to 53 percent for workers age 20-21.

It is significant that the proportion of young persons who spent 40 or more weeks in the labor force was much lower among the poor (15.9 vs. 27.2 percent for all young workers). The proportion of young Blacks, 17.9 percent, was also below the U.S. average. The proportion of Hispanics with 40 or more weeks in the labor force was 22.3 percent, somewhat closer than the proportion of all young people of the same age. (See Table 4.)

Table 4.--Commitment to labor force of young workers in 1975 by age and selected characteristics

	Weeks in Labor Force (percent of total)			
	0	1-16	17-39	40+
Total	38.6	21.6	12.6	27.2
14-17	59.2	21.6	8.4	10.8

Black	48.8	25.9	7.5	17.9
Hispanic	47.0	21.6	9.1	22.3

Source: Special tabulations of the SIE.

WORK EXPERIENCE

Roughly one in twenty young workers failed to find a job which lasted more than a week. Therefore the proportion of young people with work experience is somewhat below the proportion of young people who participated in the labor force.

The proportion of young people with work experience increases with age. Fifty-six percent of the 14-21 age group held a job for one or more weeks in 1975. This proportion ranged from a low of 35 percent of persons 14-17 to a high near 80 percent of 20-21-year-olds.

The poor and the minorities, Black and Hispanic, were less likely to have had work experience. Among the poor and the Blacks, only 40 percent of the persons in the 14-21 age group reported having had a job of one or more weeks' duration that year. Hispanics fared somewhat better, with 47 percent of the persons in this age group reporting having worked one week or more. This was still nine percent below the U.S. average. (See Table 5.)

Table 5.--Work experience of selected groups of young workers 14-21, 1975 (percent of total)

	Weeks Worked			
	0	1-16	17-39	40+
Total	44.0	20.9	14.4	20.7
14-17	64.6	18.9	8.3	8.3
18-19	25.5	26.2	21.9	26.5
20-21	19.6	19.7	19.8	40.9
Poor	60.5	22.0	10.9	6.7
Black	60.2	21.4	7.8	9.6
Hispanic	52.8	20.9	11.0	15.3

Source: Special tabulations of the SIE.

It is notable that the poor and minorities were most severely under-represented among young workers with longer work experience. The proportion of the age cohort who held jobs for 40 weeks or more was 21 percent of the total U.S. It was only 7 percent for the poor, 10 percent for Blacks, and 15 percent for Hispanics.

These disparities are narrowed, but not eliminated, if the analysis is limited to young workers with one or more weeks on the job. The proportion of workers with 40 or more weeks work experience was 37 percent. Among poor workers, 17 percent, less than half of the national average, were employed 40 weeks or more. One in four Black workers in this age group and one in three Hispanics worked over 40 weeks in 1975. (See Table 6.)

Table 6.--Distribution of young workers 14-21 by number of weeks worked, 1975
(percent of workers)

NUMBER OF WEEKS WORKED

Young workers age 14 to 21 worked an average of 29 weeks during 1975. Those who had been in the labor force less than 16 weeks worked 9.2 weeks in 1975. Those who had been in the labor force 17 to 39 weeks worked 25 weeks. And those who had been in the labor force 40 weeks or more worked an average of 44 weeks in 1975. When standardized by labor force attachment, the average number of weeks worked did not vary significantly by age. Since the proportion of persons with a long-range commitment to the labor force increased with age, so did the average number of weeks worked. (See Table 7.)

Table 7.--Mean weeks worked by young workers 14-21 by labor force attachment, 1975

	Weeks in Labor Force			
	Total	1-16	17-39	40+
Total	28.8	9.2	24.6	44.0

Black	22.5	8.6	22.3	38.0
Hispanic	26.4	8.6	23.8	41.9

Source: Special tabulations of the SIE.

Full-time and part-time workers did not differ substantially in the number of weeks worked in 1975. For full-time workers the average number of weeks was 30, and for part-time workers it was 27.

Young people who were poor worked substantially fewer weeks per year than those who were better off. Their average of 20 weeks worked was a third less than the average for all young people. Poor persons with a labor force commitment of 40 weeks or more were the most disadvantaged in this connection, having an average of only 33 weeks in 1975 as contrasted to 44 weeks for the total population. Those among them with a full-time commitment to work worked only 30 weeks in 1975, as contrasted to 37 weeks for part-time workers.

Blacks worked an average of 22.5 weeks in 1975, about 20 percent less than the U.S. average. This low figure reflects two factors: Blacks with a high commitment to the labor force worked fewer weeks than the average, and a smaller proportion of Blacks in the labor force had a high commitment to the labor force.

The figures for Hispanic workers fell somewhere between those for Blacks and the U.S. average. When standardized by labor force attachment, they show that Hispanics worked as many weeks as the average for all young workers in 1975, but that the proportion of Hispanics with a high commitment to the labor force dragged down their average to 26 weeks.

MEAN HOURS WORKED PER WEEK

On the average, young workers worked some 30 hours a week. The Blacks and Hispanics among them worked the same average number of hours per week as the others.

The major differences in hours worked were by age. Younger workers 14 to 17 with less than 16 weeks in the labor force tended to work longer hours than others of their age who had a longer attachment to the labor force. The average reported for the former group was 25 hours per week. Those with a labor force commitment of over 17 weeks worked an average of 18 to 19 hours per week. This is not surprising since the majority of them were enrolled in school, and those who worked while their school was in session were less likely to work long hours.

Eighteen- to nineteen-year-olds worked roughly 30 hours a week, irrespective of the length of their commitment to the labor force. Those in the 20-to-21-year group reported mean working hours of 34 to 37 hours, a full-time week. (See Table 8.)

Table 8.--Mean hours worked per week by young workers 14-21, 1975

	Weeks in Labor Force			
	Total	1-16	17-39	40+
Total	29.9	29.3	27.1	31.6
14-17	21.6	24.8	18.1	18.7
18-19	31.2	32.3	30.0	31.1
20-21	36.4	35.9	34.1	37.1
Part-Time Workers Total				
14-17	15.2	16.3	14.1	14.6
18-19	20.0	20.5	19.5	20.1
20-21	20.9	21.8	20.0	20.9

Source: Special tabulations of the SIE.

Among part-time workers, the number of hours worked changed with the age of the workers. Those under 18 worked 14 to 16 hours a week, depending on the length of their labor force attachment. Eighteen-to-twenty-one-year-old part-time workers worked approximately 20 hours per week, irrespective of their labor force attachment.

HOURLY EARNINGS

Young persons earned an average of $2.61 an hour in 1975. These earnings increased from $2.09 for those age 14 to 17 to $2.62 for the 18- to 19-year-olds, and $3.07 for those 20 to 21. Median earnings were somewhat lower, $2.12, and ranged from $1.67 for the 14- to 17-year-olds to $2.61 for those age 20 to 21. Female workers earned substantially less per hour than males. (See Table 9.)

Two different trends manifest themselves once workers of different age groups are examined in relation to the length of their commitment to the labor force. Younger workers 14 to 17 with a short commitment to the labor force earned more than those with a long commitment. By age 18 to 19, the trends are mixed, depending upon whether one looks at mean or median earnings. At age 20 and 21, it would appear that the mean earnings of those with short or long commitments were about equal and that the median hourly earnings tended to increase with the commitment.

The hourly earnings of persons living below the poverty level in 1975 were quite a bit lower than average. This gap in earnings tended to increase with age. Young workers 20 to 21 who were poor tended to earn a third less than the U.S. average.

Young Black workers earned as much as the average. Between the ages of 14 and 17, Black workers were likely to

earn more per hour than the average worker of their age; older Black workers lagged behind the U.S. average by a few percentage points.

The earnings of Hispanics did not differ from those of all workers. This observation applies to all three age groups. It is especially significant that Hispanic workers 20 to 21 years old with a high commitment to the labor force had average earnings as high as those of all workers, and had median incomes which were only 5 percent below the average (statistically, this is probably insignificant).

Full-time workers tended to earn slightly more per hour than all workers. However the hourly wages of female full-time workers lagged behind those of males. Persons 14 to 17 years old who claimed to work full-time earned somewhat less than the average. More significantly, the earnings of older full-time workers who were poor were a third below the U.S. average.

OCCUPATIONS OF YOUNG WORKERS

Roughly a quarter of all young workers had white-collar jobs. Another quarter had service jobs, and a third had blue-collar jobs. Sales jobs and employment on the farm accounted for 8.0 and 5.5 percent of the total employment of persons 14 to 21. The importance of white-collar occupations increased with age, as did employment in blue-collar jobs. Service, sales and farm occupations became less important as workers grew older. (See Table 10.)

These differences in occupational structure need to be examined separately by sex, since men and women fill very different jobs.

In the case of men, blue-collar jobs provided the lion's share of employment opportunities. Over half of the male workers 14 to 21 had blue-collar jobs, and this proportion increased as they became older.

The increase in the share of blue-collar employment among males occurred mostly at the expense of service jobs, and to a lesser degree of farm and sales jobs. By contrast, the proportion of white-collar workers among males, 12.8 percent overall, grew from 5.8 percent of those age 14 to 17 to 20.2 percent of workers age 20-21.

The occupational distribution of females was much more heavily weighed toward white-collar jobs. Roughly 4 out of 10 females reported being employed either in professional, managerial, or clerical occupations. Another 4 out

10 filled service jobs. Only one female in 8 reported a blue-collar occupation.

As young female workers grew older, they held more white-collar jobs. By age 20 to 21, half of all females had white-collar occupations. By contrast, the proportion of females in service occupations declined from one in three to one in four. Their share of blue-collar work remained nearly unchanged.

The occupational distribution of male workers below the poverty level was not startlingly different from that of all male workers. In both categories, 6 out of 10 males had blue-collar occupations. Men age 20 to 21 who lived in poverty were more likely to have service jobs; 19 percent of them held such jobs, compared to 12.8 percent of all males their age.

In the case of females, the differences between the poor and all female workers were (1) a higher proportion of the poor were in service jobs, one out of three as opposed to one out of four; (2) the proportion of poor females in blue-collar jobs was also substantially higher, one out of four as opposed to one out of six; and (3) the proportion of the poor in white-collar occupations, 31.6 percent, was 20 percent less than for all women workers of their age.

Black males were much more likely to have service jobs than all males. For each one of the three age groups, the proportion of Blacks in service occupations was roughly 10 percent greater than the proportion of all males. Roughly 5 percent fewer Black males than all males their age were in blue-collar occupations. However the proportion of Black males in white-collar jobs did not differ significantly from that of all males.

The occupational distribution of Black females did not differ significantly from that of all females. (See Table 11.)

Among male Hispanics, the overall distribution of occupations was similar to that of all men their age. Compared to the patterns of employment of all 14-21-year-old females, female Hispanics were more likely to be found in blue-collar jobs than in service jobs. (See Table 12.)

Among workers who were no longer enrolled in school full-time in the spring of 1976, a somewhat higher proportion of males, two-thirds, were in blue-collar occupations. The occupational distribution of females who were no longer enrolled in school was very similar to that of all females. (See Table 13.)

WORKERS WHO FOUND NO JOBS AT ALL

Roughly one out of twenty young people 14-21 looked for work in 1975, but did not hold a job for a minimum of one week.

The proportion of those who looked but were never employed did not vary significantly according to age. By contrast, a much higher proportion of persons who lived in poverty--one in ten of the age cohort--looked for work but did not find any of a week's duration. Among Blacks, the proportion was higher still: one in eight Blacks 14-21 did not land a job which lasted for a minimum of a week.

These findings can be illustrated more dramatically by calculating the percentage of young workers with previous experience in the labor force who looked for jobs in 1975 but did not find employment for one or more weeks. One of 13 potential workers did not find a job. This information is presented in Table 15. Among the youngest persons in the labor force, those age 14-17, one out of eight did not land a job of a week's duration. The number who did not find jobs declined to one out of thirteen of those age 18-19 and dropped even further to one in nineteen for persons age 20-21. The proportion of potential workers from poor and minority families who never found jobs was substantially higher: one out of five poor, one out of four Black, and one out of eleven Hispanic persons in the labor force were disappointed job seekers. (See Table 14.)

Source: Special tabulations of the SIE.

On the average, 29.6 percent of all young workers reported looking for a job for one or more weeks. Young workers who had participated in the labor force for a longer time were more likely to report having worked in 1975. Among 18-to-21-year-olds, the proportion reporting having looked for a job was constant for those who had been in the labor force for 17-39 weeks or 40 weeks or more. However a higher proportion of poor workers who had participated in the labor force 40 weeks or more experienced unemployment than those with 17-39 weeks of labor force attachment. A reported 66 percent of the poor with 40 or more weeks attachment claimed to have looked for work unsuccessfully for one or more weeks, twice the proportion of all young workers. (See Table 15.)

Source: Special tabulations of the SIE.

A high proportion of Blacks reported looking for work. At each level of labor force attachment, the proportion of Blacks looking for work was roughly 50 percent higher than the U.S. average.

By contrast, Hispanics seemed to have had better luck, especially those Hispanics who had participated in the labor force 40 or more weeks. Hispanics who had participated in the labor force less than 16 weeks fared worse than the average young worker.

The incidence of unemployment was lower among persons who were enrolled in school full-time in 1976 than among those who were no longer enrolled. Full-time students had shorter labor force attachment, and many worked only if jobs were available.

More surprisingly, high school graduates and non-high school graduates who were no longer enrolled in school reported the same incidence of unemployment. High school graduates with a labor force attachment of more than 40 weeks had less unemployment than non-high school graduates. Another significant finding is that high school graduation did not affect the incidence of unemployment significantly for young workers at the poverty level who had been in the labor force 40 weeks or more.

Whatever reasoning one uses to explain these differences in unemployment, it is obvious that young workers who lived in poverty had a much higher incidence of unemployment at all levels of commitment to the labor force. The high incidence of unemployment among young and poor workers who had 40 or more weeks of commitment to the labor force is especially disturbing. Two-thirds of the poor persons in this category experienced unemployment, whether they were high school graduates or not. This was roughly double the proportion of all workers.

LENGTH OF JOB SEARCH

Thirty percent of young workers looked for work in 1975, and they spent an average of 16 weeks looking. On the average, young workers spent 17 percent of their time in the labor force looking for work. The median number of weeks spent looking was somewhat lower, around 12 weeks.

The longer these young people's commitment to the labor force, the more time (both mean and median weeks) they spent looking for a job. Those who had been in the labor force 16 weeks or less spent the least time looking--a mean of 5.4 weeks and a median of 4.1 weeks. Those who had been in the labor force 17 to 39 weeks spent a mean of 11.6 weeks and a median of 9.1 weeks looking. Those with the highest commitment to work, 40 weeks or more, looked for a job an average of 25 weeks and a median of 24 weeks. (See Table 16.)

Source: Special tabulations of the SIE.

Blacks with 17 to 39 weeks in the labor force reported looking for work twice as long as the average for those with a similar commitment to the labor force. The poor with the same commitment looked for work 50 percent longer than average. The non-high school graduates spent slightly more time looking than did the high school graduates.

Youngsters who spent 40 weeks or more in the labor force and were either poor, Black or Hispanic were likely to have looked for work for a considerably longer time than the average. The time the poor spent looking for work was half again as long as the average, 37 weeks; the Blacks spent 41 weeks seeking work; and the Hispanics spent 30 weeks. Non-high school graduates who were poor looked for 36 weeks, while poor high school graduates spent an average of 27 weeks seeking work.

METHODS OF JOB SEARCH

Nearly all these groups of young people reported looking for jobs in the same way--the poor, the Blacks, the Hispanics, those with previous experience in the labor force, new workers who were entering the labor force, and those looking for either full-time or part-time work. Roughly half of all the workers made applications to employers directly. One in six looked for a job through friends, and about the same proportion relied on ads. Public employment agencies were mentioned by 13 percent of the workers who looked. On the average, each worker used 1.5 methods to look for a job. (See Table 17.)

Table 17.--Distribution of young workers 14-21 by selected method of job search in 1976
(percent of responses)

	Public Employment Agency	Employer	Friends	Ads	Number of Responses Per Seeker
Total	13.0	46.8	14.7	16.6	1.5

Source: Special tabulations of the SIE.

Public employment agencies played a much more important role for job seekers as they grew older. Only one in ten persons age 14 to 17 in the labor force mentioned using a public employment agency, but one in six of 20- to 21-year-olds applied to public employment agencies for a job.

The poor and minorities were also more likely to use public employment agencies. One in five of the poor, Blacks or Hispanics (as contrasted to 13 percent of the total) mentioned this avenue of job-seeking. In general the poor and the minorities were less likely to make direct applications to employers, and more likely to rely upon public employment agencies to find jobs.

PUBLIC AND PRIVATE EMPLOYERS

Two million two hundred thousand young people, slightly over 12 percent of the young workers, reported being employed by public employers in 1975. About 11 percent of the worker cohorts, age 14-17 and 18-19 were employed by government agencies. Thirteen percent of those 20-21 worked for public employers.

Most of those employed by public employers worked a short time. Fifty-one percent of them had jobs lasting less than 16 weeks, 22 percent 17-39 weeks, and 27 percent 40 weeks or more. The proportion who had jobs of longer duration increased with age. By age 20 to 21, nearly half of all workers employed worked 40 weeks or more.

Public employers accounted for 17 percent of the employment of young workers who lived in poverty. Most of these workers, 70 percent, worked less than 16 weeks, not long enough to provide them with an income that would move them out of the poverty level. Only 9 percent of the workers with poverty backgrounds worked for 40 weeks or more. (See Table 18.)

Source: Special tabulations of the SIE.

There is little evidence that public employers hired the hard-core unemployed. Persons who eventually found jobs in public employment spent the same median number of weeks looking for a job as persons who eventually landed jobs outside of the public payroll. A higher proportion of workers with poverty backgrounds who were employed by public employers spent over a week looking for a job, as contrasted to those who found private employment.

There were some differences in the public and private sectors' conditions of employment, especially for younger workers. Public employers paid more than private ones to persons 14 to 17, $1.96 an hour as compared to $1.51. Older workers also tended to be paid slightly more by public authorities as well, but the differences were minor. Among 20- to 21-year-olds, for instance, the public wage of $2.62 an hour was only slightly higher than the $2.39 paid by private enterprise. Workers from poverty backgrounds, who were employed mostly on short-term projects, were paid less than $2.00 an hour.

Younger workers 14 to 17 worked an average of 375 hours a year for public employers, as contrasted to 454 in the private sector. Among 18-to-21-year-olds the average number of hours worked did not differ significantly in public and private employment.

Over half of all public service employees were white-collar workers, 56 percent in 1975 and 55 percent in 1976. Only 21 to 22 percent were blue-collar workers. In the private sector, a third of all young workers were white-collar and 40 percent were blue-collar workers. Thus, the type of experience provided by public employers was different from that of the private sector.

It is not certain that skills were transferable between the public and private sectors. Workers 14 to 17 who had experience in the public sector suffered an unemployment rate of 33.2 percent in 1976, while only 12.8 percent of those who had been employed in the private sector were unemployed. Those age 18 to 19 who had experience in the public sector reported a 22.3 percent unemployment rate in 1976, as contrasted to only 13.2 percent for those who had been employed in the private sector. Only among the 20-21-year-olds were the unemployment rates, roughly 13 percent, equal for both groups.

A COMPARISON OF WORKERS IN 1975 AND THE SPRING OF 1976

The movement of young workers from jobs to unemployment status and then out of the labor force cannot be documented in a thoroughly consistent way because the SIE survey was conducted over a period of four months. The labor force status of persons in 1976 as reported in the survey refers to their condition in the week prior to the interview, which could have been anytime from May through July. The extension of the interview period into the summer vacation is especially unfortunate since it confounds the working patterns of students during the school year with their patterns in the summertime. Nevertheless, a comparison of the labor force status of young people during the two time periods that were examined, the whole of 1975 and the spring of 1976, can give some idea of the ebbs and flows in the youth labor market.

Some 12.7 million young persons claimed to have neither looked for work nor worked for a full week during the entire year of 1975. In the spring of 1976, 15.6 million persons were neither working or looking for work. Of these 15.6 million, two-thirds had not worked in 1975 and can be considered a hard core of non-workers. The second-highest proportion of persons who were not in the labor force in 1976 was reported among 1.8 million persons who had participated in the labor force in 1975, but never found a job. Half of them were not in the labor force in 1976. A much smaller proportion, 35.3

and 22.5 percent, of workers who had been employed either in public or private enterprises were no longer in the labor force. (See Table 19.)

Table 19.--1976 status by 1975 status of young workers 14-21 (thousands of persons)

a Less than 20 thousand.

Source: Special tabulations of the SIE.

The proportion of persons who were unemployed was also directly related to their work experience in 1975. Over a third of persons without any labor force experience in 1975 who had subsequently entered the labor force were unemployed in the spring of 1976. Among young people who had sought jobs unsuccessfully in 1975, the proportion of those who were still looking for work in the spring of 1976 was even higher, 52 percent. Only 20 percent of those who were public employees in 1975, and 13 percent of those who had been employed in private business, were unemployed in the spring of 1976.

Despite the fact that the number of jobs in the public sector had declined by a million, there was surprisingly little ebb and flow between public and private employment. Two hundred twenty-six thousand persons left private for public employment, and 315 thousand were no longer employed in the public sector and had moved on to private employers.

The movement of 20-21-year-olds in and out of the labor force and their employment patterns were different from those of young workers 14-19. Between 1975 and spring 1976, the 20-21-year-olds' labor force participation increased from 74 to 85 percent of the cohort. Unemployment was highest among those not in the labor force in 1975, followed by those who had been in the labor force but never found a job in that year. Those with work experience of any length had much shorter periods of unemployment.

Net additions to the public payroll in the 20-21 age group came mostly from new entrants to the labor force, followed by switch-overs from private employment. Only 10 percent of all employees in this age group came from the ranks of those persons who had unsuccessfully sought a job in 1975.

Among 20-21-year-olds, roughly the same number of persons switched jobs from the public to the private sectors as switched from private to public. One hundred thirty-six thousand moved from the public to the private sector, and 104 thousand took the reverse route.

Another interesting comparison is between unemployment rates in 1976 and labor force attachment in 1975. High levels of labor force attachment was associated with low levels of unemployment. All groups benefited from past presence in the labor force. Unfortunately, the poor and minorities still experienced very high levels of unemployment even in those cases where their level of attachment in the labor force in 1975 was high. (See Table 20.)

CONCLUSIONS

Our analysis documented the high labor participation of young persons, even those in their early teens. Forty-five percent of persons 14 to 17 had looked for work in 1975, and 40 percent of this age cohort had found work during that year. Among those who were 18-21, over 80 percent had looked for work and 75 percent had found work.

The proportion of young persons from minority backgrounds who sought or found jobs was much lower. Slightly more than 50 percent of all Blacks and Hispanics were in the labor force in 1975. Of these participants, two in ten never found a job.

Among the poor, 50 percent of persons in the 14-to-21 age group reported being in the labor force, and 20 percent of those in the labor force were unemployed.

The lower labor participation and work experience of the poor and minorities in 1975 put them at a considerable disadvantage in finding jobs during the spring of 1976. Past work experience is a successful ingredient in the recipe for finding or keeping a job.

There are many reasons which can be mentioned to explain the lower labor force participation of the poor and of minorities. This report documents one good reason for their non-participation in the labor force. Although the percentage of the poor and minorities who experienced unemployment during 1975 was not substantially different from that of all young workers, the duration of their job search was very much longer. Among the poor, young workers who had participated in the labor force for 40 weeks or more and reported looking for a job, 37 of those weeks had been spent looking. Even higher mean and median weeks of job seeking were reported by Blacks, and only slightly lower averages by Hispanics. Poor and minority workers who were committed to full-time participation in the world of work were plagued by exceptionally long periods of job seeking.

It is not clear to what extent formal education helped the poor and the minorities in finding jobs. Among young people who reported periods of unemployment, the poor spent more time looking for jobs than did the average high school graduate jobseeker who was not enrolled in school.

We have documented that poor persons and minorities are less likely to seek jobs by direct application to employers. They rely more heavily on the public employment service as a source of information about vacancies. Apparently the public employment service is not doing too well by them.

Another interesting statistic derived in this reanalysis relates to the occupational distribution of young workers. Among those no longer enrolled full-time, two-thirds of the males age 20 to 21 are employed in blue-collar occupations. Obviously, the lion's share of the training should be directed to blue-collar occupations.

Roughly half of young women workers filled white-collar jobs. Their training should emphasize clerical occupations.

A higher-than-average proportion of workers in service occupations lived in poverty. The wages and the irregularity of working conditions in service industries are such that persons in those occupations seldom manage to escape from poverty. Training in these occupations should get low priority.

Although public employers did employ a disproportionately large number of persons from poverty backgrounds in 1975, they provided no more than a band-aid for 70 percent of those whom they employed, offering them an average of ten weeks' work. The earnings from such employment were not sufficient to lift these people from poverty.

These findings should reinforce the determination of CETA program management not to limit their training and counselling only to applicants for CETA slots, but to seek out young people at an early age, probably 16 or 17, and place them in work situations. Their chances of holding down a job will subsequently be greatly enhanced. Otherwise the late teens and early twenties may really be years of discouragement and frustration for a large number of young persons.

1/ Poor are persons falling below 1975 poverty threshold.

SOURCE: Special Tabulations of The Survey of Income and Education, 1976.

APPENDIX I

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of the data. The estimates for the Survey of Income and Education (SIE) are based on data collected from personal interviews conducted in May and June of 1976 with a small number occurring in April and July. This survey was conducted by the Bureau of the Census acting as collection agent for the Department of Health, Education, and Welfare.

Approximately 158,500 households, selected independently in the 50 States and the District of Columbia, were eligible for interview in SIE. Of this number, 7,300 interviews were not obtained because the occupants were temporarily absent, refused to be interviewed, or, after repeated callbacks, could not be found at home. In addition to the 158,500 households, there were about 33,000 sample units which were visited and found to be vacant, condemned, unfit, demolished, etc., and therefore were ineligible for interview. The distribution of the occupied households, noninterviews, and households ineligible for interview by State is shown in table A-1.

The sample design for the SIE sample was a stratified multistage cluster design. Each State was divided into areas made up of counties and independent cities referred to as primary sampling units (PSU's). These PSU's were then grouped to form strata within each State according to the proportion of persons who were children 5 through 17 years old living in poverty families at the time of the 1970 census. Some strata consisted of only one PSU (generally the larger metropolitan areas and some larger nonmetropolitan PSU's) which came into sample with certainty and which were called self-representing. In nine States (Connecticut, Delaware, District of Columbia, Hawaii, Maryland, Massachusetts, New Hampshire, Rhode Island, and Vermont) every PSU was made self-representing. In the remaining States, two PSU's were selected without replacement from each of the strata which were not self-representing. These sample PSU's are called non-self-representing PSU's.

Within selected PSU's, a sample of housing units enumerated in the 1970 Census of Population and Housing was selected. In addition, a sample of new construction building permits was also selected to represent the units constructed in areas under the jurisdictions of building permit offices (permit-issuing areas) since the 1970 census. Further, a sample of units constructed since the 1970 census in areas not under the jurisdiction of building permit offices (non-permit-issuing areas) and units from mobile home parks established since the 1970 census was selected.

Estimation procedure. The first step in the estimation procedure involved the inflation of the sample data by the reciprocal of the probability of its selection. Next, adjustments were made to account for occupied households in which interviews were not obtained because the occupants were temporarily absent, refused to be interviewed, or, after repeated callbacks, could not be found at home. This adjustment was made separately to households in different race of head-residence-1970 census poverty level categories.

In order to obtain more reliable estimates, various stages of ratio estimation were employed which made extensive use of available auxiliary data on characteristics of the survey population. The source of most of this auxiliary data was geographic information about the sample units, 1970 census data and current independent population counts.

The first stage of ratio estimation was employed for sample households from non-self-representing (NSR) PSU's only. This procedure adjusted for the differences that existed at the time of the 1970 census in the distribution of persons by race and residence as estimated from the sample NSR PSU's and from the NSR population in each State. This ratio estimation was designed to reduce the variance attributable to the sampling of PSU's.

Additional stages of ratio estimation were employed to adjust for coverage problems and to bring the distribution of the sample population into agreement with the distribution of the population from which the sample was selected. The second stage of ratio estimation was only employed for new construction sample units (i.e., sample units built April 1, 1970 or later) in permit-issuing areas. The sample estimate of new construction in these areas was ratio-adjusted to agree with an independently derived estimate from the Survey of Construction (SOC), a survey of building permits conducted monthly by the Bureau of the Census.

In the third stage the national sample estimates of civilian persons were controlled to independently derived national estimates for various age, race, and sex categories. To these totals were added the population estimates of those in the armed forces living off post or with their families on post. The fourth stage adjustment was made so that the husband and wife of a family received the same weight. Finally, the last stage adjusted the State sample estimates of civilian persons to agree with independently derived estimates of State population for three age categories in each State.

The last three stages in the estimation procedure were repeated in an iterative procedure in order to bring the SIE estimates into close agreement with both the national and State independent estimates. The effect of these final stages of ratio estimation, as well as the overall estimation procedure, was to reduce the error for most statistics below what would have been obtained by simply weighting the results of the SIE sample by the inverse of the probability of selection.

Reliability of the estimates. There are two types of possible errors associated with estimates based on data from a sample survey--sampling and nonsampling error. The following is a description of the sampling and nonsampling errors associated with SIE.

Nonsampling variability. In general, nonsampling errors can be attributed to many sources: inability to obtain information about all cases, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, mistakes in recording or coding the data, and other errors of collection, response, processing, coverage, and estimation for missing data. As can be seen from the above list, nonsampling errors are not unique to sample surveys since they can, and do, occur in complete censuses as well.

It should be pointed out that steps used in the estimation procedure to reduce errors due to nonresponse and coverage deficiencies introduce nonsampling errors of their own. However, the errors introduced are believed to be smaller than the errors due to nonresponse and coverage deficiencies.

Coverage Errors. It was mentioned previously that the SIE sample was selected from four frames: (1) the 1970 census, (2) new construction in permit-issuing areas, (3) new construction from non-permit-issuing areas, and (4) mobile home parks established since the 1970 census. These four frames do not completely cover the total housing unit inventory, and hence there are some coverage deficiencies in the SIE sample.

More importantly, though an estimate has not been determined, SIE also missed a considerable number of persons who live in housing units eligible for enumeration in SIE. It has been speculated that more persons were missed from within eligible housing units than from housing units missed due to coverage deficiencies in the housing inventory.

It has been estimated that the 1970 census missed about 2-½ percent (i.e., about 1.7 million units) of the total 1970 housing inventory. These units have also been missed by SIE.

During the sampling of building permits, only those permits issued between January 1, 1970 and November 1975 inclusive, were eligible to be sampled to represent new construction in permit-issuing areas. It had been assumed that units with permits issued prior to 1970 would have been completed by the time of the 1970 census (i.e., April 1970) and, therefore, would have been represented in the sample selected from the 1970 census units. Due to time constraints, it was not possible for units whose permits were issued after November 1975 to be selected in time to be interviewed during the SIE interview period. It has been estimated that the new construction misses were about 8 percent (i.e., about 900,000 units) of all new construction units.

In addition to the above missed units, mobile homes that were not in parks and that were either placed in their current site after the 1970 census or were vacant at the time of the census, housing units that were converted from nonresidential to residential use since the census, and housing units that have been moved since the census had no chance of being selected for the SIE sample. No estimate currently exists of the total number of missed units in these categories.

The ratio estimation procedure discussed above has partially corrected the survey data for these coverage deficiencies. That is, the ratio estimation adjusts the level and distribution of the survey estimates so that they agree with the known, independently derived national and State estimates. If the characteristics of missed persons were the same as those of covered persons little bias would remain after the application of this procedure, but that missed persons differ from covered persons some bias remains, e.g., if missed persons in a particular age-sex-race category tended to have a much lower educational attainment than the covered persons, then educational attainment would be overstated.

Evaluation Studies. There was no evaluation of errors on language and education estimates. Particular effort was made. however, to evaluate the accuracy of the measurement of poverty according to the present definition. A principal component of this evaluation was a return visit, by different interviewers, to approximately 5 percent of the households in the SIE sample. For these selected households an independent interview was conducted, referring only to necessary identifying information from the first interview. The sample, approximately 9,000 households, permitted inclusion of features intended to produce a more accurate measurement. For example, persons age 16 and over were asked to respond for themselves, whenever possible, even when repeated callbacks were required. A new questionnaire was designed to ask each respondent first about the source of income of the respondent during 1975 and then to obtain the amount for each of these sources by detailed questions. These reinterviews were compared with the original interviews and the bias of the choice of survey procedures on the estimate of poverty was measured. At the national level, the reinterview results on the number of children age 5-17 in poverty families were within sampling error of the SIE result. In addition, the reinterview provided no firm statistical evidence that any particular region of the country was inequitably treated relative to the others by systematic error.

Sampling error. The particular sample used for this survey is one of a large number of possible samples of the same size that could have been selected using the same sample design. Even if the same schedules, instructions, and enumerators were used, estimates from each of the different samples would differ from each other. The variability between estimates from all possible samples is defined as the sampling error. One common measure of sampling error is the standard error which measures the precision with which an estimate from a sample approximates the average result of all possible samples. In addition, the standard error, as calculated for this report, partially reflects the variation in the estimates due to some nonsampling errors, but it does not measure, as such, any systematic biases in the data. Therefore, the accuracy of the estimates depends on both the sampling and nonsampling errors, measured by the standard error, and biases and some additional nonsampling errors not measured by the standard error.

The procedure, as illustrated below, provides a method to construct interval estimates such that a known proportion of the intervals would contain the average of all possible samples. For example, if all possible samples were selected, each of these surveyed under identical conditions and an estimate and its estimated standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples;

2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples;

3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average result of all possible samples either is or is not contained in any particular computed interval. However, for a particular sample one can say with specified confidence that the average result of all possible samples is included in the constructed interval.

Table A-2 presents a and b parameters for national language and education items. In general we found that the standard errors for the national language and education items fell into two classes. The first class with the larger standard errors and hence larger b parameter, represents children 5-17 enrolled in school except for those handicapped or retained in their grade, and children 5-17 and persons 18+ with non-English language background (NELB). The second class with smaller standard errors, and hence smaller b parameter, represents post-secondary enrolled, 4 or more years college attained, 1 to 3 years college attained, dropped out of school, and handicapped or retained in grade children 5-17 enrolled in school.

All of the other national items seemed to fall into two distinct groups. The first group having a very large b parameter, represents characteristics concerning persons and their income and such totals as total poor persons, total black persons, and total Spanish Origin persons. The second group has a small b parameter and represents characteristics concerning families and their income and such totals as total families, total non-white families, total Spanish Origin families, total female-headed families, persons 65+, and total unemployed. The a and b parameters for these items are given in table A-3.

From the parameters, the standard errors for estimated numbers can be calculated. The formula is given by

$$SE(X) = \sqrt{(aX^2 + bX)}$$

where X is the estimated number. The standard errors for estimated proportions can also be calculated using the formulas

$$SE(p) = \sqrt{\frac{b}{y}\, p(1-P)} \quad \text{or} \quad SE(100p) = \sqrt{\frac{b}{y}\, 100p(100-100p)}$$

where y is the size of the base (that is, the size of the total upon which the percentage is based) and p is the proportion (or, 100p is the percentage).

For small estimates, the following formulae should be used instead of those given above. Although the formulae below give overestimates of the true standard errors they are appropriate for the construction of confidence intervals.

$$SE(x) = \frac{b}{1-a} \quad \text{when } 0 \leq x \leq \frac{b}{1-a}$$

$$SE(p) = \frac{b}{y+b} \quad \text{or } SE(100p) = 100\,\frac{b}{y+b} \quad \text{when } 0 \leq p \leq \frac{b}{y+b}$$

Also shown in table A-2 are the estimated numbers and the estimated standard errors used to derive the a and b parameters. These standard errors were calculated directly from the survey data and are direct estimates of the standard errors. In the following illustrations of the use of the standard error formulae shown above, standard errors are calculated for some of the estimates shown in table A-2. These standard errors will differ slightly from those shown in the table. The calculations in the examples are included primarily for illustration.

Illustration of the use of the table of parameters. The estimate of the total number of persons in the United States who have attained four or more years of college is 21,962,000. The a and b parameters for this characteristic as shown in table A-2 are -.0000102253 and 1284.13 respectively. Square the estimate and multiply by a (i.e., $(21{,}962{,}000)^2 \times (-.0000102253)$). Add this product, -4,931,963,264, to the product of b multiplied by the estimate. This gives a result of 23,270,099,796. The standard error of the estimate is about 153,000. (i.e.,

$\sqrt{23{,}270{,}099{,}796}$).

Consequently, the 68 percent confidence interval, as shown by these data, is from 21,809,000 to 22,115,000 persons. Therefore, a conclusion that the average estimate, derived from all possible samples, lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude that the average estimate, derived from all possible samples, lies within the interval from 21,656,000 to 22,268,000 persons with 95 percent confidence.

Of these 21,962,000 persons who have attained four or more years of college, 416,000 or 1.89 percent are Spanish. Table A-2 shows the corresponding b for this characteristic to be 1284.13. Multiply 1.89 by (100-1.89). Multiply this product by .0000584705

(i.e., $\left(\frac{1284.13}{21962000}\right)$).

Thus, the standard error of the estimated proportion is the square root of this product, i.e., .10. Consequently, the 68 percent confidence interval, as shown by these data, is from 1.79 to 1.99 percent, and the 95 percent confidence interval is from 1.69 to 2.09 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squared standard errors of the estimates. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error; whereas, if there is a high negative correlation, the formula will underestimate the true standard error.

Suppose we wish to compare the estimate of 297,000 children 5-17 from a French language background to the estimate of 267,000 children 5-17 from a German language background. The apparent difference between these two characteristics is 30,000. The a and b parameters for children 5-17 from French language backgrounds and children 5-17 from German language backgrounds are -.0000516549 and 2603.96, respectively. Thus, the standard error for the children from French language backgrounds is 27,728. And the standard error for the children from German language backgrounds is 26,298. The standard error of the estimated difference of 30,000 is

$$\sqrt{(27{,}728)^2 + (26{,}298)^2} = 38{,}216$$

Thus the standard error is about 38,000.

Consequently, the 68 percent confidence interval for the 30,000 difference is from -8,000 to 68,000. Therefore a conclusion that the average estimate of this difference, derived from all possible samples, lies within a range computed in this way would be correct for approximately 68 percent of all possible samples. Similarly, we could conclude that the average estimate of this difference, derived from all possible samples, lies within the interval from -46,000 to 106,000 with 95 percent confidence.

Because 0 lies between the limits of both the 95 and 68 percent confidence intervals, we cannot conclude with 95 percent confidence or even 68 percent confidence that there is a difference between the number of children 5-17 with French language background and the number of children 5-17 with German language background.

Illustration of the comparison of percentages. Of the estimated 11,196,000 Spanish origin persons in the United States, 486,000 or 4.34 percent are enrolled in post-secondary schools. The standard error of 4.34 percent on a base of 11,196,000 with a b parameter of 1284.13 is .22 percent.

Suppose that we wish to compare the estimate of 4.34 percent Spanish persons post-secondary enrolled with the above estimate of 1.89 percent Spanish persons who attained four or more years of college. The apparent difference is 2.45 percent. The standard error of the difference is

$$\sqrt{(.22)^2 + (.10)^2} \quad = .24$$

Thus the 68 percent confidence interval for the difference is 2.21 to 2.69. Therefore, a conclusion that the average estimated difference, derived from all possible samples, lies within the range computed in this manner would be correct for roughly 68 percent of all samples. The 95 percent confidence interval is from 1.97 to 2.93. Thus we conclude with 95 percent confidence that the percent of Spanish persons enrolled in post-secondary schools is greater than the percent of Spanish persons who have attained four or more years of college.

Standard errors of estimated means and medians. The following sections are provided to enable the user to calculate standard errors for the estimates of means and medians when the distributions are known.

Medians. The median is that value which is at the center of a distribution (the 50th percentile). Half of the data lies above the median and half of the data lies below it. The median can be approximated by linear interpolation within the group that contains it if not calculated directly from the sample data. Computation of the confidence interval for medians is described below.

The sampling variability of an estimated median depends upon the size of the base as well as the distribution from which the median is determined. An approximate method for measuring the reliability of a median is to determine an interval about the estimated median, such that there is a stated degree of confidence that the median based on all possible samples lies within the interval. The following procedure may be used to estimate a 68 percent confidence interval of a median based on sample data: (1) determine the standard error of a 50 percent characteristic using the base of the distribution and the appropriate b parameter; (2) add to and subtract from 50 percent, the standard error determined in step (1); (3) multiply the values of the two points established in (2) by the base for the distribution to yield the confidence interval's upper and lower distribution points; (4) interpolating in the distribution of the characteristic, calculate the upper and lower confidence limits corresponding to the distribution points established in (3). A 95 percent confidence interval may be determined by finding the values corresponding to 50 percent plus or minus twice the standard error determined in step (1).

Illustration of the computation of a confidence interval for a median. The income distribution for Hispanics in the United States is given below.

Income Percentage Distribution for Hispanics in the U.S.

4,999	5,000-9,999	10,000-14,999	15,000-19,999	20,000+
23.2	24.2	15.9	14.5	22.2

The median income for Hispanics is about $10,800 on a base of 11,196,000 persons.

(1) The standard error of 50.0 percent on a base of 11,196,000 and a b parameter of 4523.28 is 1.00 percent.

(2) To obtain a 95 percent confidence interval on an estimated median, add to and subtract from 50 percent twice the standard error found in (1). This yields percent limits of 48.0 and 52.0, which corresponds to 5,374,080 (i.e., .480 x 11,196,000) and 5,821,920 (i.e., .520 x 11,196,000) persons.

(3) From the table above, the income of 5,306,904 or 47.4 percent Hispanics is less than $20,000 and 1,780,164 or 15.9 percent had income between $10,000 and $14,999. By linear interpolation, the lower confidence limit on the estimated median is found to be about

$$10{,}000 + 5{,}000 \left[\frac{5{,}374{,}080 - 5{,}306{,}904}{1{,}780{,}164}\right] = 10{,}190$$

Similarly, the upper confidence limit on the estimated median is found to be about

$$10{,}000 + 5{,}000 \left[\frac{5{,}821{,}920 - 5{,}306{,}904}{1{,}780{,}164}\right] = 11{,}450$$

Thus, the 95 percent confidence interval on this median is from $10,190 to $11,450.

Illustration of the computation of the standard error of a mean. To get a rough estimate of the standard error of a mean, the following formula can be used:

$$\sigma_{\bar{x}} = \sqrt{b\left(\frac{{}_{i=1}\, p_i x_i{}^2 - \bar{x}^2}{Y}\right)}$$

where p_i is the proportion of total cases in the i^{th} class.

x_i is the midpoint of the i^{th} class, with the midpoint of open-ended class taken to be 3/2 times its lower limit.

$\bar{x}$ is the mean value of the distribution, i.e., $\sum\limits_{i=1}^{c} p_i x_i$.

Y is the base of the distribution.

and b is the appropriate b parameter.

For the distribution used above in the example for medians, the mean income is $13,580. From the distribution, we can calculate $\sum\limits_{i=1}^{c} p_i x_i{}^2 - \bar{x}^2$ to be 99,696,100. The base is 11,196,000 and the factor b is 4523.28. Completing the calculation, the standard error is approximately 200.

Consequently, the 95 percent confidence interval, as shown by these data, is from 13,180 to 13,980. Therefore a conclusion that the average estimate, derived from all possible samples, lies within a range computed in this way would be correct for approximately 95 percent of all possible samples.

NOTE: When two or more distributions are combined, the mean of the combined distribution is $\bar{x} = \frac{1}{Y} \sum\limits_{j} \bar{x}_j Y_j$ where $\bar{x}_j$ is the mean of the j^{th} distribution, Y_j is the base of the j^{th} distribution, and $Y = \sum Y_j$.

Table A-1. Survey of Income and Education Households and Noninterview Rate: Spring 1976

Regions, divisions, and States	Total households	Households occupied				Households visited, not occupied	
		Total	Interviewed	Not interviewed		Number	Rate (6)÷(1)x100

TABLE A-2

Class 1., Standard errors and variance parameters of national language and education estimates for children 5-17 enrolled in school and national estimates of persons 5-17 and 18+ with non-English language background.

Size of Estimate(X) (000)	SE(X) (000)	Item	Variance Parameters	
			a Parameter	b Parameter
		CLASS 1:	-.0000516549	2603.96
297	34	Children 5-17 from French language background		
267	25	Children 5-17 from German language background		
29,781	138	White children 5-17 enrolled in school		
7,626	128	Nonwhite children 5-17 enrolled in school		
6,966	125	Poor children 5-17 enrolled in school		
3,299	97	Spanish Origin children 5-17 enrolled in school		
1,754	68	Children 5-17 enrolled in school with non-English language background (NELB) and non-English usual language		
908	55	Children 5-17 enrolled in school with Spanish language background and non-English usual language		
1,646	61	Native children 5-17 with NELB and non-English usual language		
396	36	Nonnative children 5-17 with NELB and non-English usual language		
786	46	Native children 5-17 with Spanish language background and non-English usual language		
250	30	Nonnative children 5-17 with Spanish language background and non-English usual language		
4,550	95	Native persons 18+ with non-English usual language and NELB		
3,612	106	Nonnative persons 18+ with non-English usual language and NELB		
1,699	60	Native persons 18+ with Spanish language background and non-English usual language		
1,724	86	Nonnative persons 18+ with Spanish language backgorund and non-English usual language		

Class 2. Standard errors and variance parameters of national education estimates for post-secondary enrolled, college attainment, dropped out of school, and handicapped and retained ingrade children 5-17.

Size of Estimate(X) (000)	SE(X) (000)	Item	Variance Parameters a Parameter	Variance Parameters b Parameter
		CLASS 2:	.0000102253	1284.13
12,093	119	Total post-secondary enrolled		
1,250	42	Black post-secondary enrolled		
486	29	Spanish post-secondary enrolled		
578	24	Handicapped post-secondary enrolled		
1,396	46	NELB post-secondary enrolled		
986	39	Poverty post-secondary enrolled		
5,498	75	Female post-secondary enrolled		
5,811	79	White male post-secondary enrolled		
7,011	91	Age 18-24 post-secondary enrolled		
671	29	Black age 18-24 post-secondary enrolled		
248	20	Spanish age 18-24 post-secondary enrolled		
241	15	Handicap age 18-24 post-secondary enrolled		
706	34	NELB age 18-24 post-secondary enrolled		
693	33	Poverty age 18-24 post-secondary enrolled		
3,315	58	Female age 18-24 post-secondary enrolled		
3,306	61	White male age 18-24 post-secondary enrolled		
21,962	171	Total who attained 4+ years college		
1,028	38	Blacks who attained 4+ years college		
416	25	Spanish who attained 4+ years college		
1,093	32	Handicapped who attained 4+ years college		
2,741	64	NELB who attained 4+ years college		
826	34	Poor persons who attained 4+ years college		
9,239	96	Females who attained 4+ years college		
11,936	106	White males who attained 4+ years college		
4,852	72	Age 25+ post-secondary enrolled		
24,486	164	Whites who attained 1-3 years college		
2,569	64	Nonwhites who attained 1-3 years college		
1,979	43	Handicapped 5-17 enrolled in school		
3,066	54	Children 5-17 enrolled in school and retained in grade		
597	28	Persons 14-21 with NELB who have dropped out of school		
2,420	52	White persons age 14-21 who have dropped out of school		
606	26	Nonwhite persons age 14-21 who have dropped out of school		
842	31	Poverty persons age 14-21 who have dropped out of school		

TABLE A-3. Variance parameters for individual and family income estimates.

	a Parameter	b Parameter
Group 1	-.0000281309	4523.28
Group 2	-.0000160917	1072.91
